

TSLCENTRALDB Operations Manual

AUTOMATED MAP PIPELINE & TROUBLESHOOTING GUIDE | MAINTAINER: SILVER REPUBLICS

1. Architecture Overview & Data Flow

This project hosts the interactive regional map for **The Southern Lands**. The architecture avoids background daemon processes or client-side CORS issues by utilizing an event-driven static asset build pipeline.

2. Component Breakdown & System Roles

- **GitHub Repository** ([SilverCoderTSL/TSLCENTRALDB](#)): Acts as the authoritative source control for scripts (`fetch-region.js`), static views (`map.html`), and Netlify build configurations (`netlify.toml`).
- **Netlify Build Engine**: Linked to GitHub. When triggered via code push or build hook, Netlify executes `node fetch-region.js` on its build containers, generates a fresh `region-map-data.json`, and publishes the static deployment.
- **cron-job.org (Scheduler)**: A lightweight external timer configured to send an HTTP `POST` payload to Netlify's secret Build Hook URL every 6 hours.

3. Common Maintenance Tasks

Pushing Code Changes: Run `git add .` → `git commit -m "commit message"` → `git push origin main`. Netlify will deploy immediately.

4. Troubleshooting Guide

- Issue 1: Map Data Is Stale or Not Updating**
- **Check cron-job.org logs:** Ensure pings respond with HTTP status `200 OK` or `202 Accepted`. Click "Run Now" to force execution.
 - **Check Netlify Build Logs:** Go to Netlify Dashboard → *Deploys*. Check if `node fetch-region.js` encountered API errors or formatting timeouts from NationStates.

Issue 2: Git Push Authentication / SSL Failures

- **Custom SSL/CA Errors:** Run `git config --global http.https://github.com/.sslVerify false` or configure your custom `.cert` bundle using `git config --global http.sslCAInfo /path/to/cert.crt`.
- **Password Rejected:** Use a Personal Access Token (PAT) starting with `ghp_` instead of your raw account password, or configure SSH remote URLs.

5. Schedule Adjustments

To change the update frequency, log into **cron-job.org** → *Cronjobs* → *Edit*. Update the cron schedule expression (e.g., `0 */3 * * *` for every 3 hours) and save.
